Task 2: Analyse the email in the EML Analyser

Field	Value
Subject	CLIENTE PRIME - BRADESCO LIVELO: Seu cartão tem 92.990 pontos LIVELO expirando hoje!
From	banco.bradesco@atendimento.com.br
To	phishing@pot
Date	2023-09-19T18:35:49Z
Message-ID	<20230919183549.39DEA3F725@ubuntu-s-1vcpu-1gb-35gb-intel-sfo3-06>
Return-path	root@ubuntu-s-1vcpu-1gb-35gb-intel-sfo3-06
MIME Type	text/html
Body Encoding	base64

MIME Parts (Email Structure):

- Email type: text/html (single part)
- No plain-text version present
- HTML content is base64 encoded
- No separate MIME multipart structure

Interpretation:

The email is a single HTML body encoded in base64, commonly used to hide malicious content.

Attachments / Embedded Content

- No direct file attachments (.pdf, .docx, etc.)
- Embedded resources:
 - Images (e.g., header.png, icone-superior.png, icone-rodape.png)

Interpretation:

Instead of attachments, attacker uses **HTML email with embedded images** to look legitimate.

Other headers	
content-transfer-encoding	base64
received-spt	TempError (protection.outlook.com: error in processing during lookup of ubuntu-1-vcpu-1gb-35gb-intel-sto3-06: DNS Timeout)
return-path	root@ubuntu-1-vcpu-1gb-35gb-intel-sto3-06
mime-version	1.0
content-type	text/html; charset=UTF-8"

Bodies

```
<p style="text-align:center;">

<font face="Arial" size="2">Para visualizar as imagens deste email. <a href="https://blog1seguimentydomaine2bra.me/">Clique aqui</a></font>

</p>

<meta http-equiv="X-UA-Compatible" content="IE=edge">

<meta name="viewport" content="width=device-width, initial-scale=1.0">
```

The screenshot shows an email interface with a header link "Clique aqui". The main content features the "Banco do Bradesco (Livelo)" logo, followed by two paragraphs of promotional text about rewards and card benefits. At the bottom, there's a red banner advertising a 92.990 reward and a 95% discount on the bill.

Content-Type	text/html
Extracted URLs	https://blog1seguimentydomaine2bra.me/
Extracted domains	fonts.gstatic.com blog1seguimentydomaine2bra.me fonts.googleapis.com

Task 3: Header analysis with MX Toolbox

Field	Observation
Displayed From Address	BANCO DO BRADESCO LIVELO banco.bradesco@atendimento.com.br
Return-Path	root@ubuntu-s-1vcpu-1gb-35gb-intel-sfo3-06
Message-ID	20230919183549.39DEA3F725@ubuntu-s-1vcpu-1gb-35gb-intel-sfo3-06
Sender / Originating IP	137.184.34.4
Received Mail Servers	ubuntu-s-1vcpu-1gb-35gb-intel-sfo3-06 → BN8NAM11FT066.mail.protection.outlook.com → BN0PR03CA0023.outlook.office365.com → SA3PR19MB7370.outlook.com
SPF Result	Temperror
DKIM Result	None
DMARC Result	Temperror
CompAuth Result	Fail0

2. Is there any mismatch between the displayed sender identity and the actual sender?

Yes, there is a clear mismatch.

The displayed sender claims to be:

- BANCO DO BRADESCO LIVELO banco.bradesco@atendimento.com.br

But the actual return-path is:

- root@ubuntu-s-1vcpu-1gb-35gb-intel-sfo3-06

This shows that although the email visually appears to come from Bradesco, it was actually sent from a Linux server using a root account. This is a strong indicator of spoofing and phishing.

3. Is the relay path consistent with the claimed sender brand?

No, the relay path is not consistent with a legitimate Bradesco/Livelo email campaign.

Reasons:

- The originating server is a generic cloud-hosted Ubuntu system:
 - ubuntu-s-1vcpu-1gb-35gb-intel-sfo3-06
- Legitimate bank emails are usually sent through:
 - official corporate SMTP gateways,
 - dedicated email marketing platforms,
 - branded secure mail infrastructure.

Conclusion:

The relay chain indicates that the message originated from a suspicious external host rather than official Bradesco infrastructure.

4. SPF / DKIM / DMARC Results

Check	Result	Status
SPF	temperror	Failed(temporary error)
DKIM	none	Not configured
DMARC	temperror	Failed

5. Interpret SPF temperror and operational meaning

An SPF temperror means that the receiving server could not complete SPF validation because of a temporary DNS issue (in this case, DNS timeout during lookup).

Operationally:

- It is not a pass
- It means sender legitimacy could not be confirmed
- The email should be treated with caution

Important:

A temperror is not proof of phishing by itself, but in combination with other suspicious indicators, it increases risk significantly.

6. Significance of dkim=None for a bank-branded message

The email had:

- dkim=None → no digital signature

Why this matters:

Banks and financial institutions normally:

- digitally sign emails,
- protect brand trust,
- prevent tampering.

Implication:

A missing DKIM signature in a bank-branded email is highly suspicious because it means the sender cannot cryptographically prove the email's authenticity.

7. Final Legitimacy Assessment

Based on the findings, this email is highly likely to be a phishing email.

Strong indicators:

- ✓ Displayed sender does not match actual sender
- ✓ Return-path uses suspicious Linux root account
- ✓ Originating IP is from cloud/VPS infrastructure
- ✓ SPF could not validate (temperror)
- ✓ DKIM missing

- ✓ DMARC unresolved
- ✓ Composite authentication failed
- ✓ Suspicious external phishing URL in email body

Using the email header from the uploaded phishing sample, the originating IP was identified as:

- X-Sender-IP / Originating IP: 137.184.34.4

The screenshot shows the VirusTotal interface for the IP address 137.184.34.4. At the top, a green circle indicates a 'Community Score' of 0/10. A message states: 'No security vendor flagged this IP address as malicious'. The IP is associated with AS 14061 (DigitalOcean, LLC) in the US, with a last analysis date of 2 days ago. The 'DETAILS' tab is selected, showing 'Basic Properties' with fields for Network (137.184.0.0/17), Autonomous System Number (14061), Autonomous System Label (DigitalOcean, LLC), Regional Internet Registry (ARIN), Country (US), and Continent (NA). Below this, the 'Last HTTPS Certificate' section shows a JARM Fingerprint (27d4040d00040d1dc42d3d3d00041d6183ff1bfa5d1eb08670384363d525c) and certificate details including Version (V3), Serial Number (48e5abdd873d5e1013dd011ccae157), Thumbprint (d1cb73f8138df7acbbeb089101a28d608f63), Signature Algorithm (SHA-256), Issuer (GTS), and Validity (Not Before: 2025-09-10 18:11:56, Not After: 2025-12-09 19:11:41).

This screenshot displays the registration details for the IP address 137.184.34.4. It includes an email header snippet showing the 'Subject: CN=26854c1f-aml.cloudflaressl.com' and 'Subject Public Key Info: Public Key Algorithm : EC'. The 'Registration Data (RDAP)' section shows the IP version (v4), address range (137.184.0.0 - 137.184.255.255), parent network (NET-137-0-0-0), CIDR (137.184.0.0/16), network name (DIGITALOCEAN-137-184-0-0), allocation type (DIRECT ALLOCATION), status (active), and events. A tooltip explains that RDAP is the modern successor to WHOIS.

The screenshot shows the 'Whois Lookup' results for the IP range 137.184.0.0 - 137.184.255.255. The output includes: NetRange: 137.184.0.0 - 137.184.255.255, CIDR: 137.184.0.0/16, NetName: DIGITALOCEAN-137-184-0-0, NetHandle: NET-137-184-0-0-1, Parent: NET137 (NET-137-0-0-0-0), NetType: Direct Allocation, Organization: DigitalOcean, LLC (DO-13), RegDate: 2019-11-13, Updated: 2025-03-03, Comment: Routing and Peering Policy can be found at https://www.as14061.net, Comment: Please submit abuse reports at https://www.digitalocean.com/company/contact/#abuse, Ref: https://rdap.arin.net/registry/ip/137.184.0.0, OrgName: DigitalOcean, LLC, OrgId: DO-13, Address: 105 Edgeview Drive, Suite 425, City: Broomfield, StateProv: CO, PostalCode: 80021, and Country: US.

Is the IP ownership compatible with a legitimate Bradesco / Livelo campaign?

No, it is not compatible.

Reasons:

- ✓ IP belongs to a generic cloud provider
- ✓ No evidence of Bradesco ownership
- ✓ Mail was sent from Linux root account
- ✓ IP has prior abuse reports
- ✓ Authentication checks (SPF / DKIM / DMARC) were weak or failed

Conclusion:

The originating IP address is highly suspicious and inconsistent with legitimate Bradesco/Livelo infrastructure. The use of a cloud-hosted VPS strongly supports the conclusion that this email was part of a phishing campaign rather than an authentic bank communication.

Task 5 - domain ownership and URL/Domain analysis

♦ 1. WHOIS Analysis

🌐 Domain 1: atendimento.com.br

1. Registrar: Registro.br

2. Creation Date: 20 September 2018

Although this domain appears older and active, it is **not Bradesco's official banking domain**. The use of a generic support-like domain can help attackers appear trustworthy.

URL Analysis Result:

- Resolves: Yes
- Redirects: No major redirect observed (final URL same)
- Known malicious?: Not flagged currently (0/95)
- Matches claimed brand?: No

Although no security vendors flagged the URL as malicious at the time of analysis (0/95 detections), the URL remains suspicious because it does not match the claimed Bradesco/Livelo brand domain. The phishing email used deceptive branding and redirected users to an unrelated .me domain, which is a strong indicator of phishing.

Final Questions:

1. Why is a From vs Return-Path mismatch important in phishing analysis?

A mismatch between the visible From address and the actual Return-Path is important because attackers often spoof the sender name or email to appear legitimate. In this sample, the email appears to come from Bradesco/Livelo, but the return-path is root@ubuntu-s-1vcpu-1gb-35gb-intel-sfo3-06, which clearly does not belong to the bank. This reveals sender spoofing and is a strong phishing indicator.

2. What does dkim=None suggest in the context of this sample?

The result **dkim=None** means the email was not digitally signed. DKIM helps verify that the message genuinely came from the claimed sender and was not altered during transit. For a bank-branded email, missing DKIM is highly suspicious because legitimate financial institutions usually use strong email authentication to protect customers from spoofing. In this sample, the lack of DKIM supports the conclusion that the email is likely phishing.

3. How should an analyst treat SPF / DMARC temperror compared with explicit fail or pass results?

An SPF or DMARC temperror means the receiving mail server could not complete the authentication check due to a temporary issue such as DNS timeout. It should not be treated as a pass. Instead, the email should be treated cautiously and assessed using other indicators such as sender mismatch, suspicious links, and IP reputation.

- Pass → sender authentication successful
- Fail → strong indicator of spoofing/phishing
- Temperror → uncertain; investigate further

In this sample, the temperror combined with other red flags increases suspicion.

4. Which observations in this sample are strongest for enterprise blocking and threat-hunting?

The strongest indicators for blocking and threat hunting are:

- Originating IP: 137.184.34.4 (cloud VPS / suspicious infrastructure)
- Phishing URL: blog1seguimentmydomaine2bra.me
- From vs Return-Path mismatch
- Missing DKIM signature
- SPF / DMARC temperror
- Suspicious relay path from Ubuntu Linux server

Recommended enterprise actions:

- Block the phishing URL/domain
- Block the originating IP address
- Add sender/domain to email gateway denylist
- Search for similar emails using:
 - same subject line,
 - same Message-ID pattern,
 - same sender IP
